

# Something Old, Something New, Something Borrowed, Something Blue

Multi-wavelength Spectroscopic Surveys in the (pre-)SKA Era

Luke Davies

GAMA, G10 lead, DEVILS PI, WAVES PS

# Old, New, Borrowed, Blue

- The SKA and precursors will produce produce a wealth of radio data, over the southern sky.
- To maximise the science potential of this data we require auxiliary multi-wavelength and spectroscopic observations
- Australia is leading the world multi-wavelength spectroscopic galaxy evolution surveys:

(note, I am going to focus on synergy with these deep small → medium area projects c.f. Taipan, WISE, LSST, eROSITA... for full hemisphere)

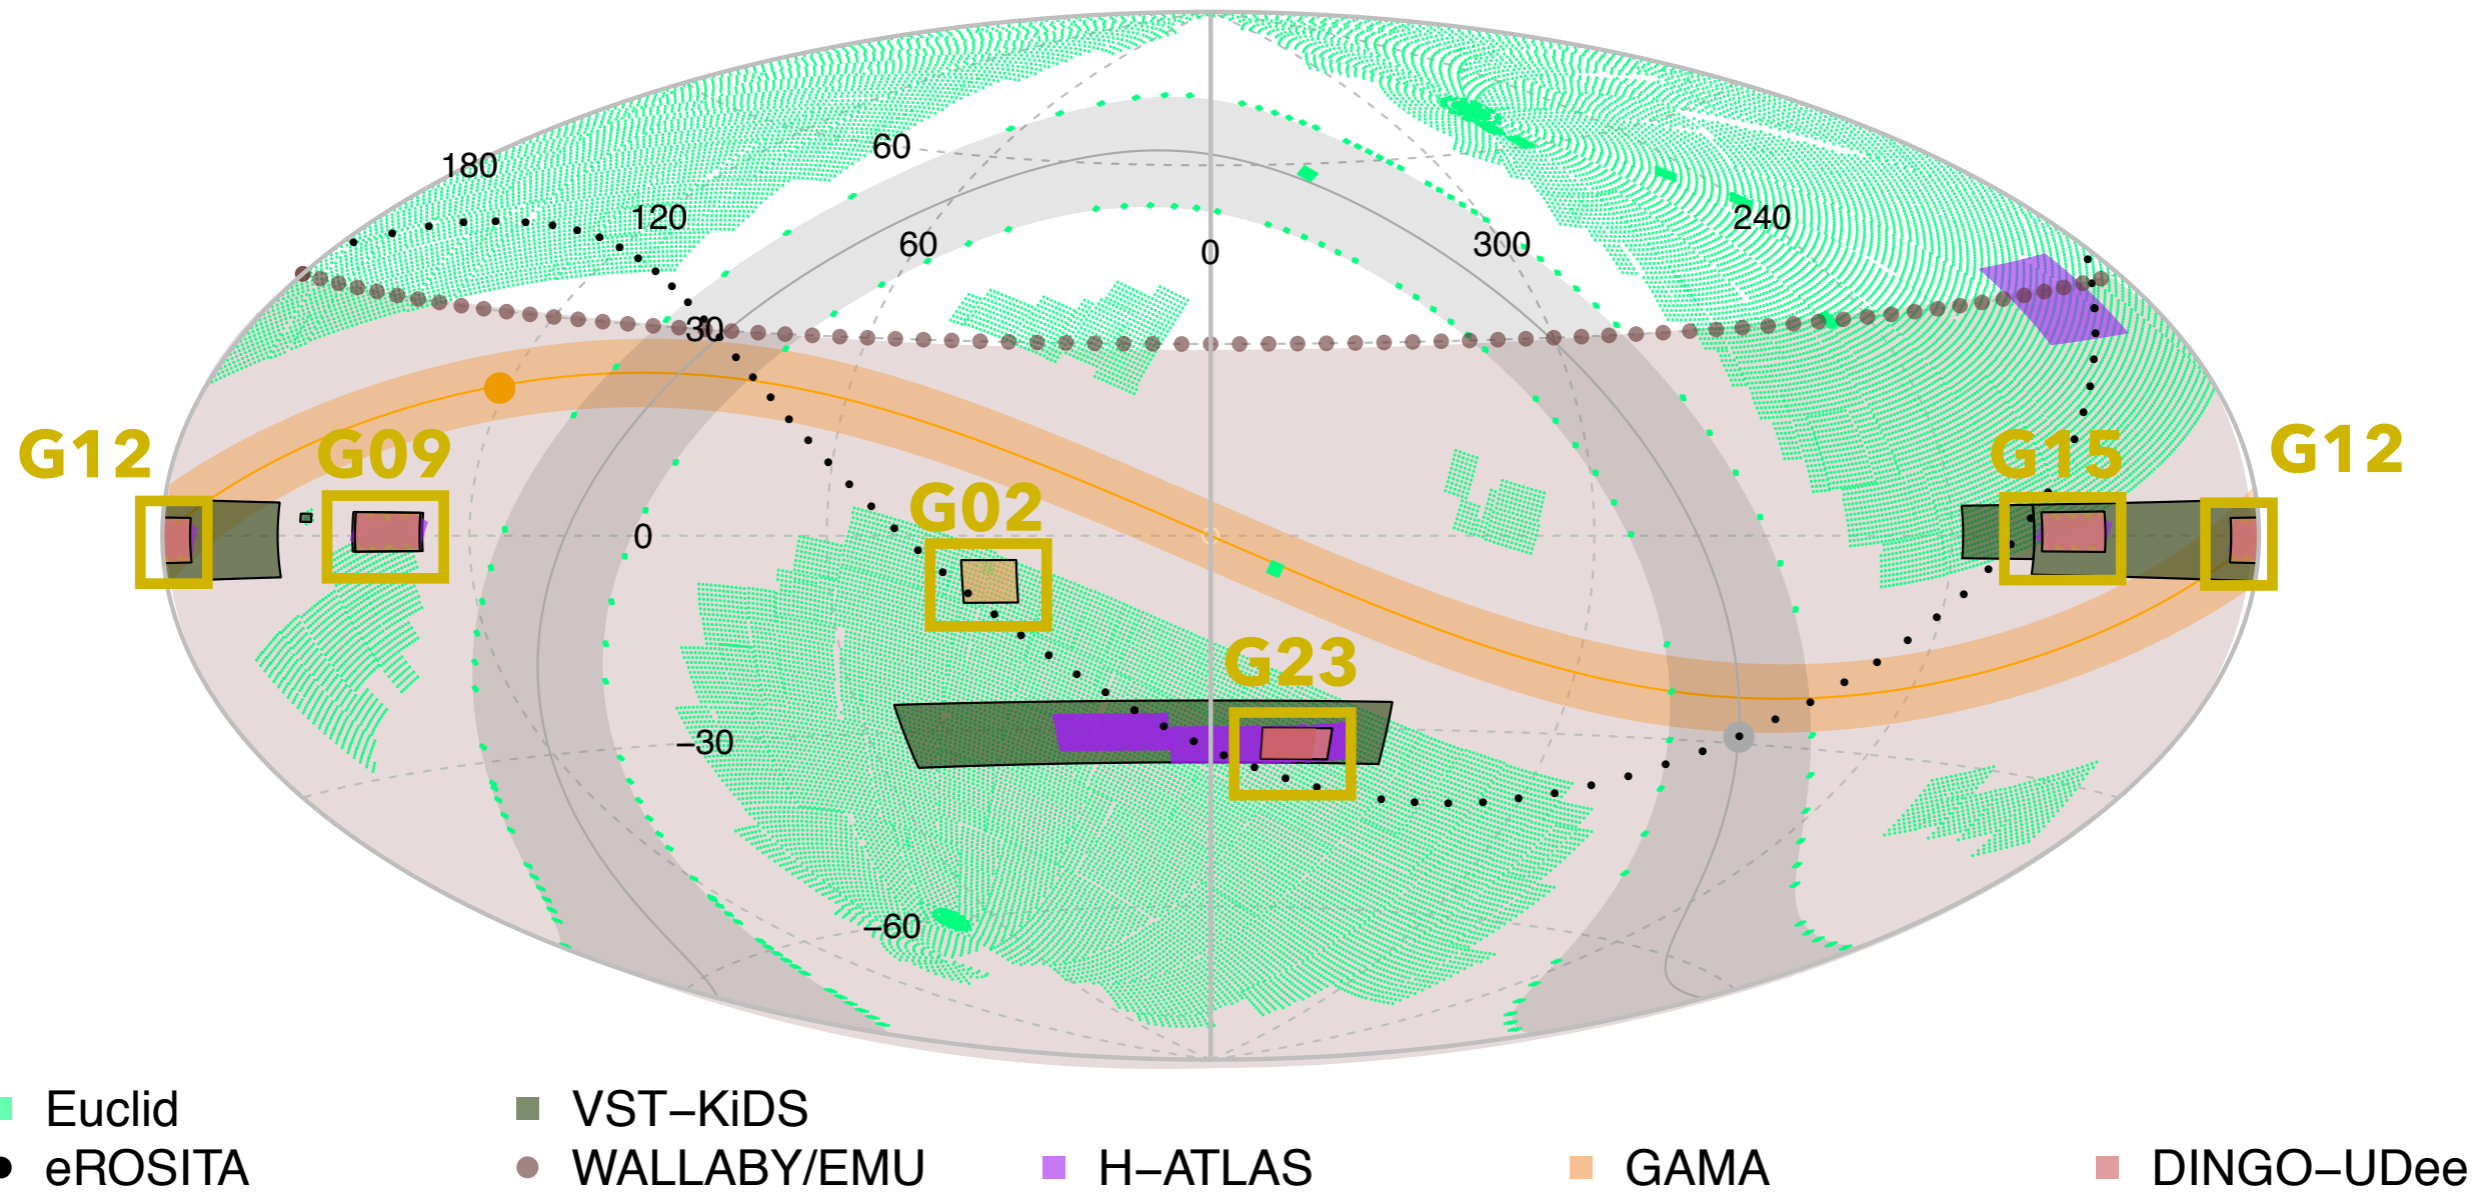

# Galaxy And Mass Assembly Survey

- ~300,000 galaxies with spectroscopic redshifts
  - r-mag < 19.8 to >98% completeness
- Covering ~286deg<sup>2</sup> over 3 equatorial and 2 southern Field
- Extensive multi-wavelength coverage on 21-bands and derived properties (stellar mass, SFR, bulge-disc decomposition, morphology,...)
- Robust group and pair catalogue for environmental metrics

# Galaxy And Mass Assembly Survey

[www.astromap.icrar.org](http://www.astromap.icrar.org)

# Galaxy And Mass Assembly Survey

- Tonnes of GAMA data description and science papers - Driver et al (2013,2015), Hopkins et al (2013), Liske et al (2015)....

Mass-size relation

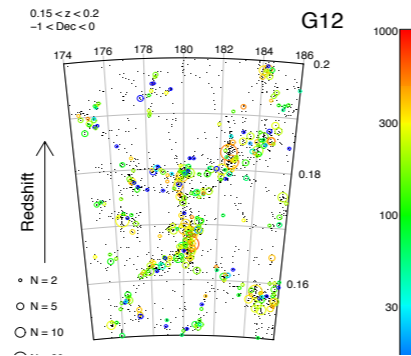

Bulge-disc decomposition

SED modelling

Galaxy Bimodality

Groups

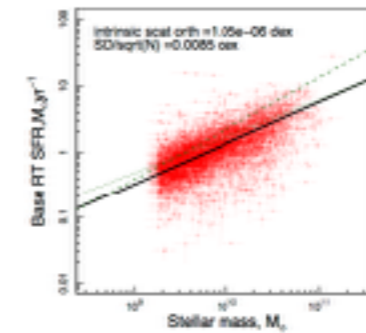

LSS

Galaxy interactions

Mass-metallicity relation

SFR-M\* Relation

Cosmic SED

Local Group Analogues

Cosmic SFH

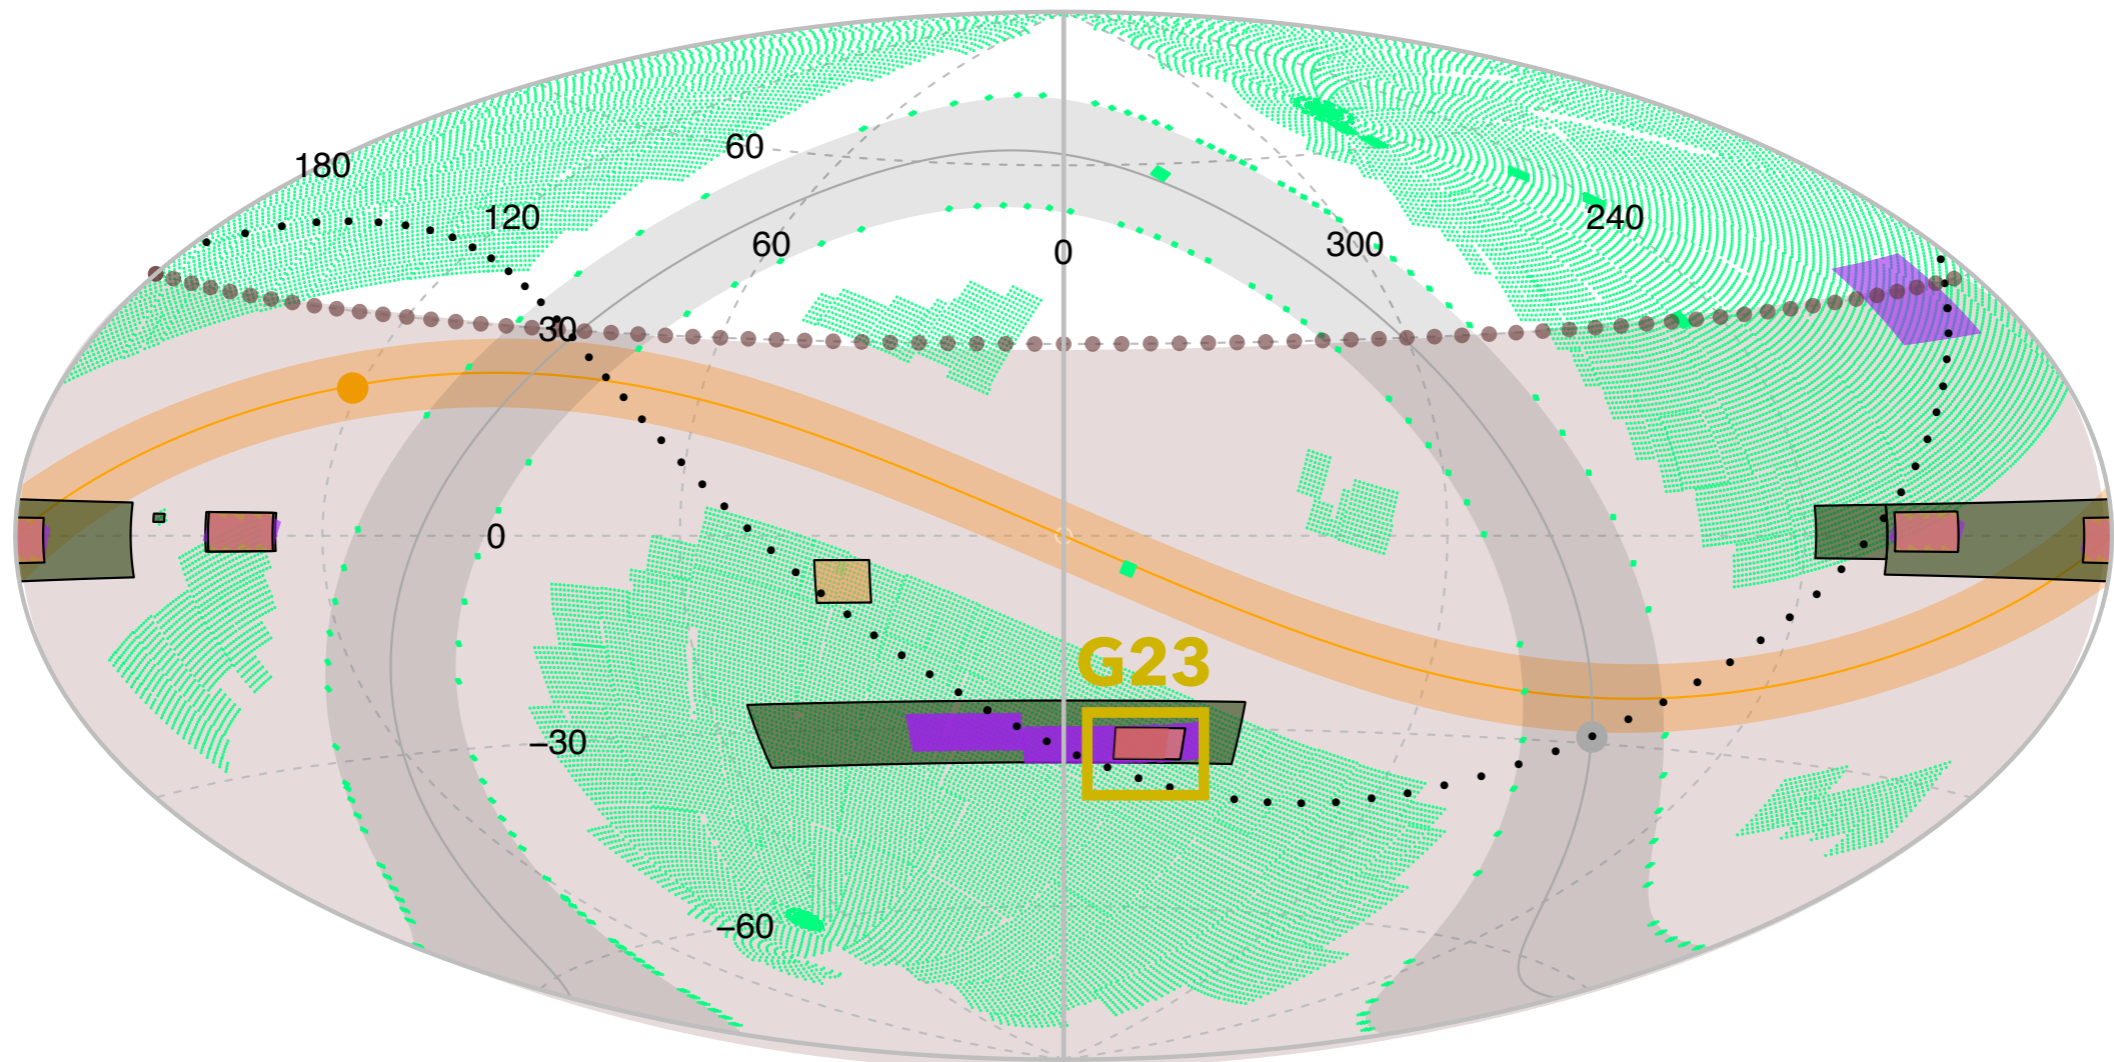

Stellar Mass function

AGN

# Galaxy And Mass Assembly Survey

# GAMA 23h Field

- The G23 field is rapidly becoming one of the most well studied fields in the southern sky:

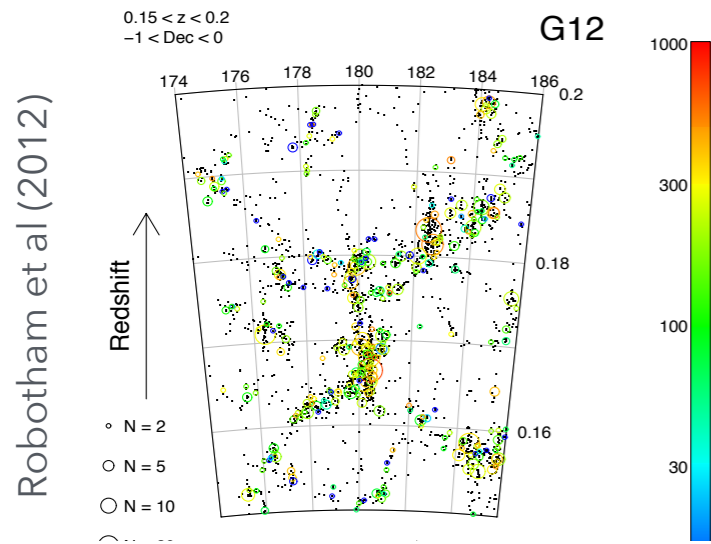

# GAMA 23h Field

- G23 multi-wavelength coverage:

- Groups and pairs for environment effects:

- Large stellar mass selected samples for stacking:

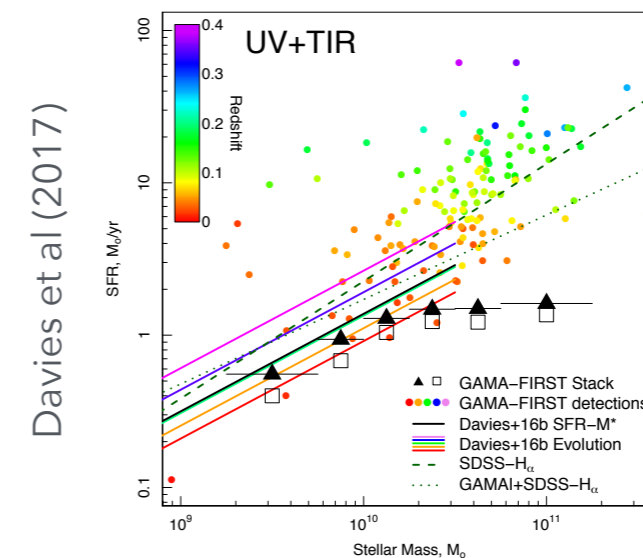

- 1.4GHz Luminosity function evolution

- Multiple SFR diagnostics for comparison to radio continuum (SF timescales):

- Stellar/Dust masses + HI for baryonic mass function, radio SFR-M\* relation:

# Going Further Than GAMA

Survey such as.....

... have provided a wealth of information about the galaxies and structure in the local Universe.

In order to go beyond this we can either:

- Probe out to higher redshifts and explore the formation of the fundamental relation observed by GAMA and SDSS

- Probe to fainter limits to extend the relations of observed by GAMA and SDSS to lower stellar and halo masses

# Going To High-z

Many of the fundamental trends observed by SDSS/GAMA, such as.....

- **Fundamental galaxy scaling relations** (SMF, SFR- $M^*$ ,  $M^*$ - $M_{\text{HI}}$ ...)
- **Environmental trends** (morphology-density, SFR-density,...)
- **Distribution of DM halos** (Halo Mass Function, merger rates...)

.... were forged at  $z > 0.3$

We have (somewhat) robustly parametrised these relations at  $z \sim 0$ :

There is also currently a large focus on determining these relations at high- $z$  ( $z > 1$ ):

However there is a paucity of well sampled, complete and statistically robust surveys at intermediate redshift. ( $0.3 < z < 1$ )

# Going To High-z

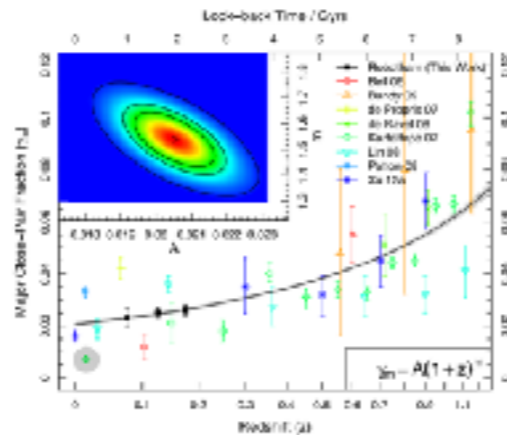

This is a key epoch in the formation of these fundamental relations:

Moffet et al.

Various components of SMF assembled

Robotham et al.

Major merger rates evolve dramatically

Lee et al.

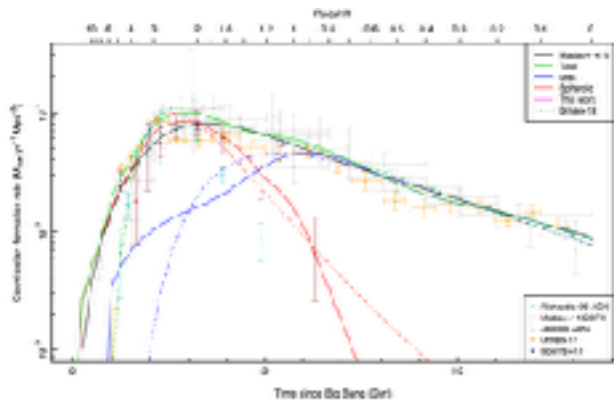

The SF-MS evolves in slope and normalisation

van der Wel et al.  
+ Lange et al.

Size-mass relation evolves

Andrews et al.

Disc growth begins to dominate over spheroidal growth

Tasca et al.

The environmental density relations reverse

Murray et al.

$\Lambda$ CDM predicts a strong evolution of the high mass HMF

.... also this is the epoch where the next generation of HI/continuum surveys will probe (EMU, LADUMA, MIGHTEE, DINGO.... SKA)

# "Borrowing" Redshifts

- The initial stages of our expansion to higher- $z$  came from a re-analysis and curation of spectra in the COSMOS region (Davies et al. 2015) - mainly zCOSMOS
- We then also performed GAMA-like photometric analysis (Stephens et al. 2016) and MAGPHYS SED fitting on the sample (Driver et al MNRAS submitted)

Davies et al (2015)

GAMA  
G10/  
COSMOS

- ~16,000 galaxies with spectroscopic redshifts
  - i-mag < 22 to ~50% completeness
  - Covering ~2deg<sup>2</sup> in COSMOS
- New photometric catalogue from 38 band photometry from LambdaR
  - Full MAGPHYS runs of all galaxies for derived properties
    - Covers CHILES region

# Going To High-z

However, in order to perform the majority of GAMA-like science we require fully sampled populations (Groups/Pairs/Stellar Mass complete samples):

# Deep Extragalactic Visible Legacy Survey

@devilsurvey

# DEVILS

DEEP EXTRAGALACTIC VISIBLE LEGACY SURVEY

- Upcoming Large Program survey of ~60,000 galaxies with spectroscopic redshifts
  - Y-mag < 21.2 to >95% completeness
  - Covering ~6deg<sup>2</sup> in COSMOS, ECDFS, and XMM-LSS
- Extensive multi-wavelength coverage and derived properties (stellar mass, SFR, bulge-disc decomposition, morphology,....)
  - Robust group and pair catalogue for environmental metrics
    - Covers CHILES, LADUMA, MIGHTEE, EMU-ES regions

# Deep Extragalactic Visible Legacy Survey

- DEVILS will perform GAMA-like science out to  $z \sim 1$ :

# Deep Extragalactic Visible Legacy Survey

- **DEVILS** will target field with extensive existing or upcoming multi-wavelength and spectroscopic data
- Will piggy-back off existing spectra to reach  $>95\%$  with minimal observing time (OzDES, zCOSMOS...)

- LSST deep-drill fields, VIDEO, SPLASH, XMM, MeerKat, EMU-ES....

- Formation the environmental trends we observe at  $z \sim 0$
- Formation the fundamental relations, such as the SMF
- Evolution of bulge, disk, bar and spiral arm components.
- Parameterisation of the late time evolution of the HMF predicted by  $\Lambda$ CDM

**DEVILS** field covered in deep HI (CHILES, LADUMA, MIGHTEE) and radio continuum (MIGHTEE, COSMOS-VLA, CHILESConPol, EMU-ES).

Redshifts for stacking, environmental metrics, SFR diagnostics....

Environmental effect on HI and robust constraints on gas and continuum emission in simulations. Also compiling extensive multi-wavelength database

# Wide Area VISTA Extragalactic Survey

@wavessurvey

- Upcoming survey of 2M galaxies with spectroscopic redshifts
- **Wide** -  $Z\text{-mag} < 21.5$  &  $z_{\text{photo}} < 0.2$  | **Deep** -  $Z\text{-mag} < 21.5$  to  $> 95\%$  completeness
  - **Wide** -  $\sim 1350\text{deg}^2$  of KiDS/VIKING | **Deep**  $\sim 100\text{deg}^2$  in G23 & ?
- Extensive multi-wavelength coverage and derived properties (stellar mass, SFR, bulge-disc decomposition, morphology,....)
  - Robust group and pair catalogue for environmental metrics
- **Wide** -  $\sim 1350\text{deg}^2$  of WALLABY/EMU | **Deep** - aligned with DINGO

# WAVES Science: Groups

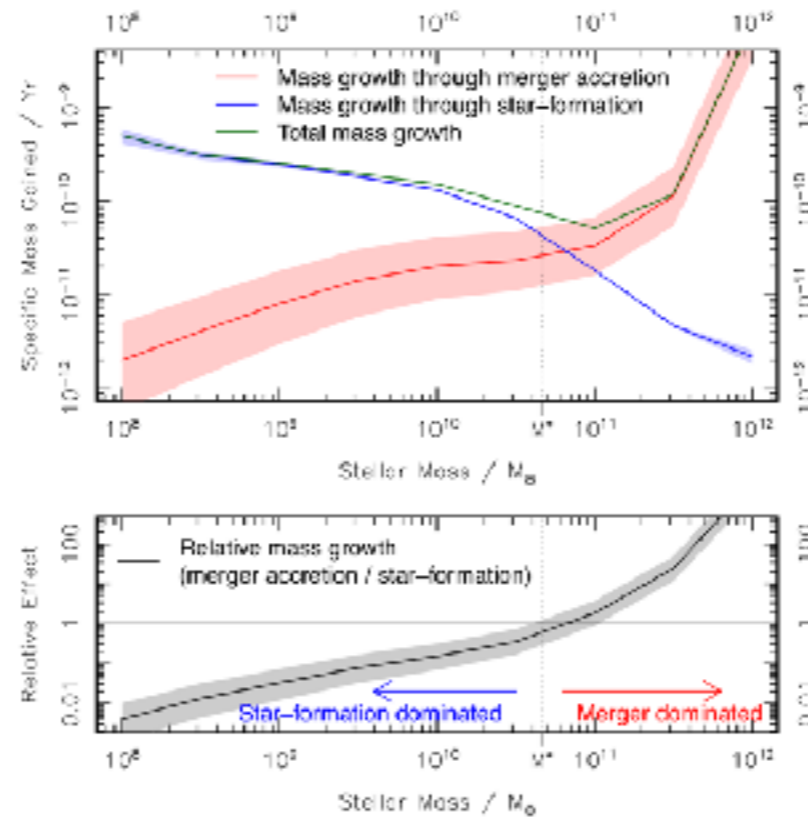

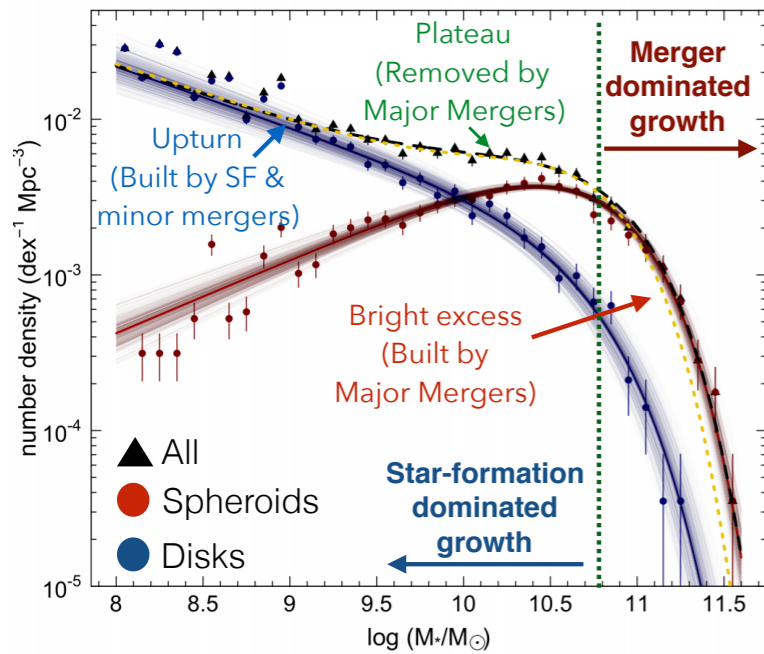

**Analytic Function exactly predicts GAMA Halo Mass Function at  $z \sim 0$  (Robotham et al in prep)**

# WAVES Science: Formation Of Fundamental Relations

- Combining local environment with galaxy properties to probe the genesis of fundamental relations:

Contribution of morphological types to  $z \sim 0$  SMF (Moffett et al.)

Contribution of mergers and SF in shaping the  $z \sim 0$  SMF (Robotham et al.)

Contribution of environment in shaping the  $z \sim 0$  SMF (Alpaslan et al.)

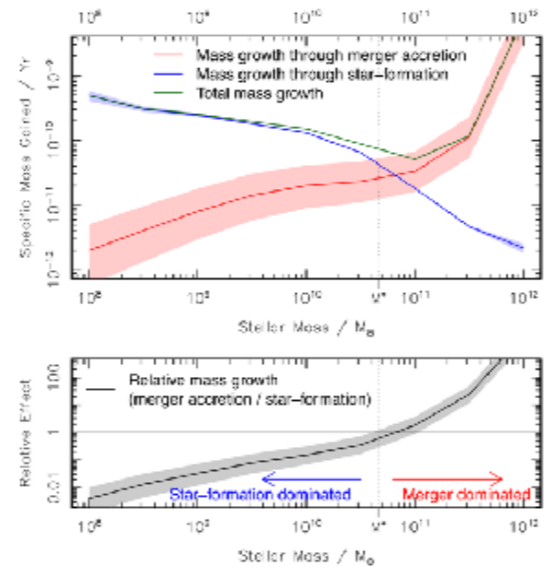

# WAVES Science: Formation Of Fundamental Relations

- With WAVES-deep we can add a 'time' axis to these relations:

z

z

z

- How does the distribution of different morphological types and components evolve since  $z \sim 1$ ?
- How do they shape the SMF at each epoch?
- How does this combine to form the  $z \sim 0$  SMF?

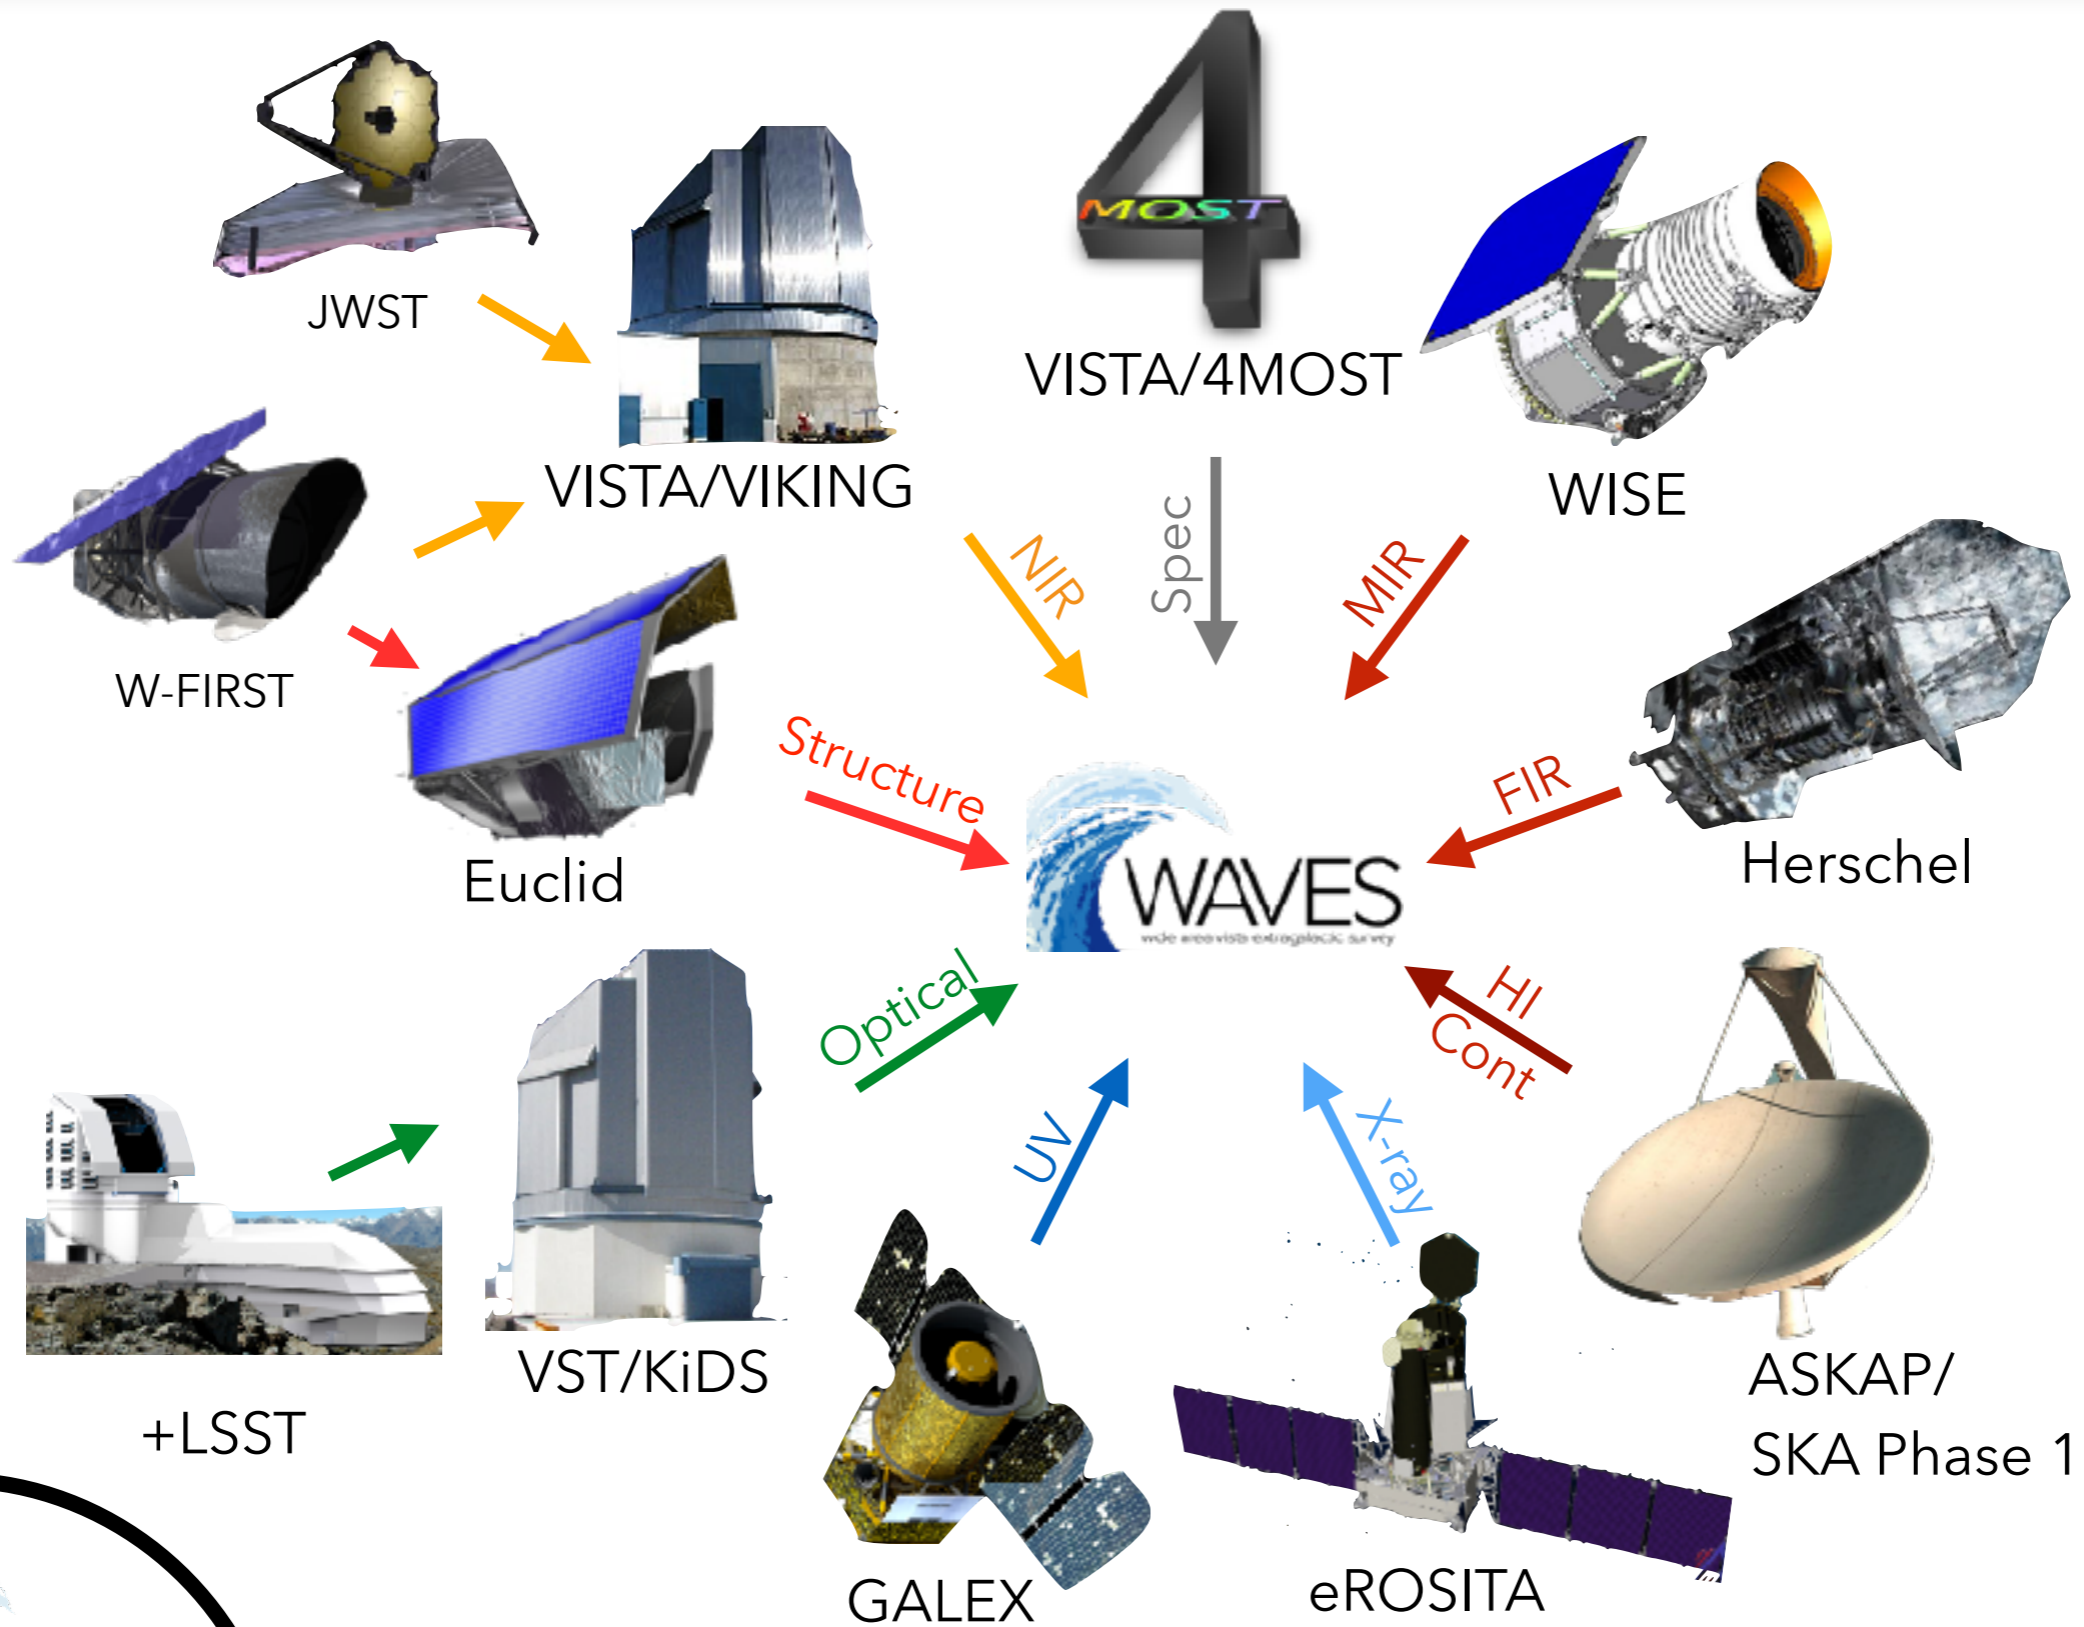

- How does the relative contribution of mergers and SF to mass growth evolve?
- At any given epoch how are they changing the shape of the SMF?
- Can we combine the observed merger and SF-driven mass growth to produce the  $z \sim 0$  SMF?

- How is environment driving mass growth at each epoch?
- How does this produce the morphology-density relation?
- How do environmental effects over the last 8Gyr shape the  $z \sim 0$  SMF?

**Formation of  $z \sim 0$  SMF!**

# WAVES as a Legacy Resource

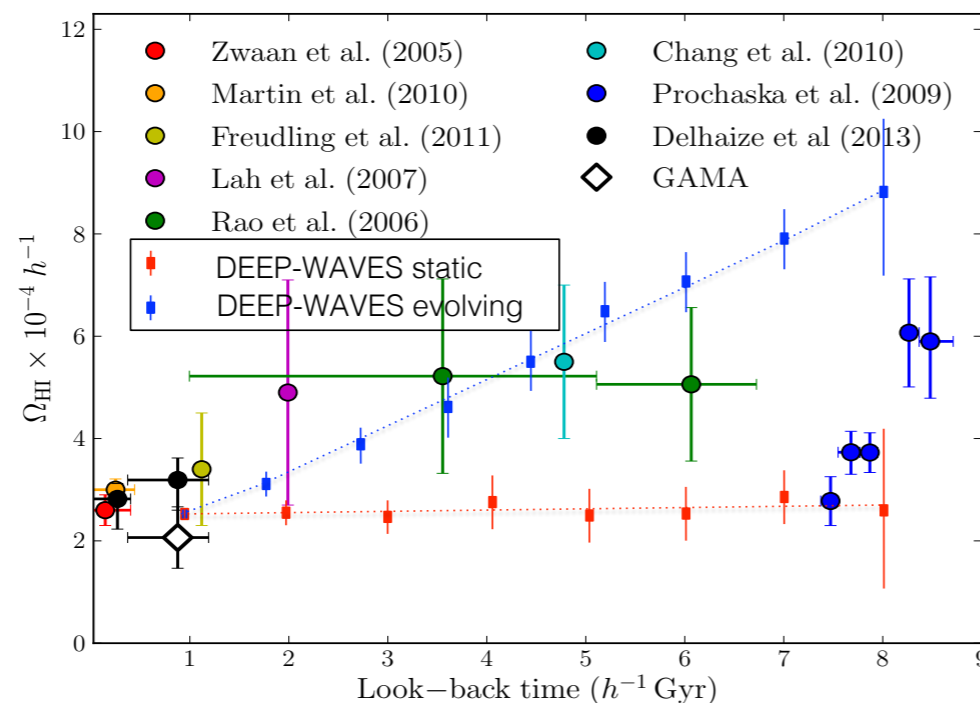

# WAVES and SKA-precursors

WAVES-wide - 1 Million galaxies in WALLABY/EMU/GLEAM

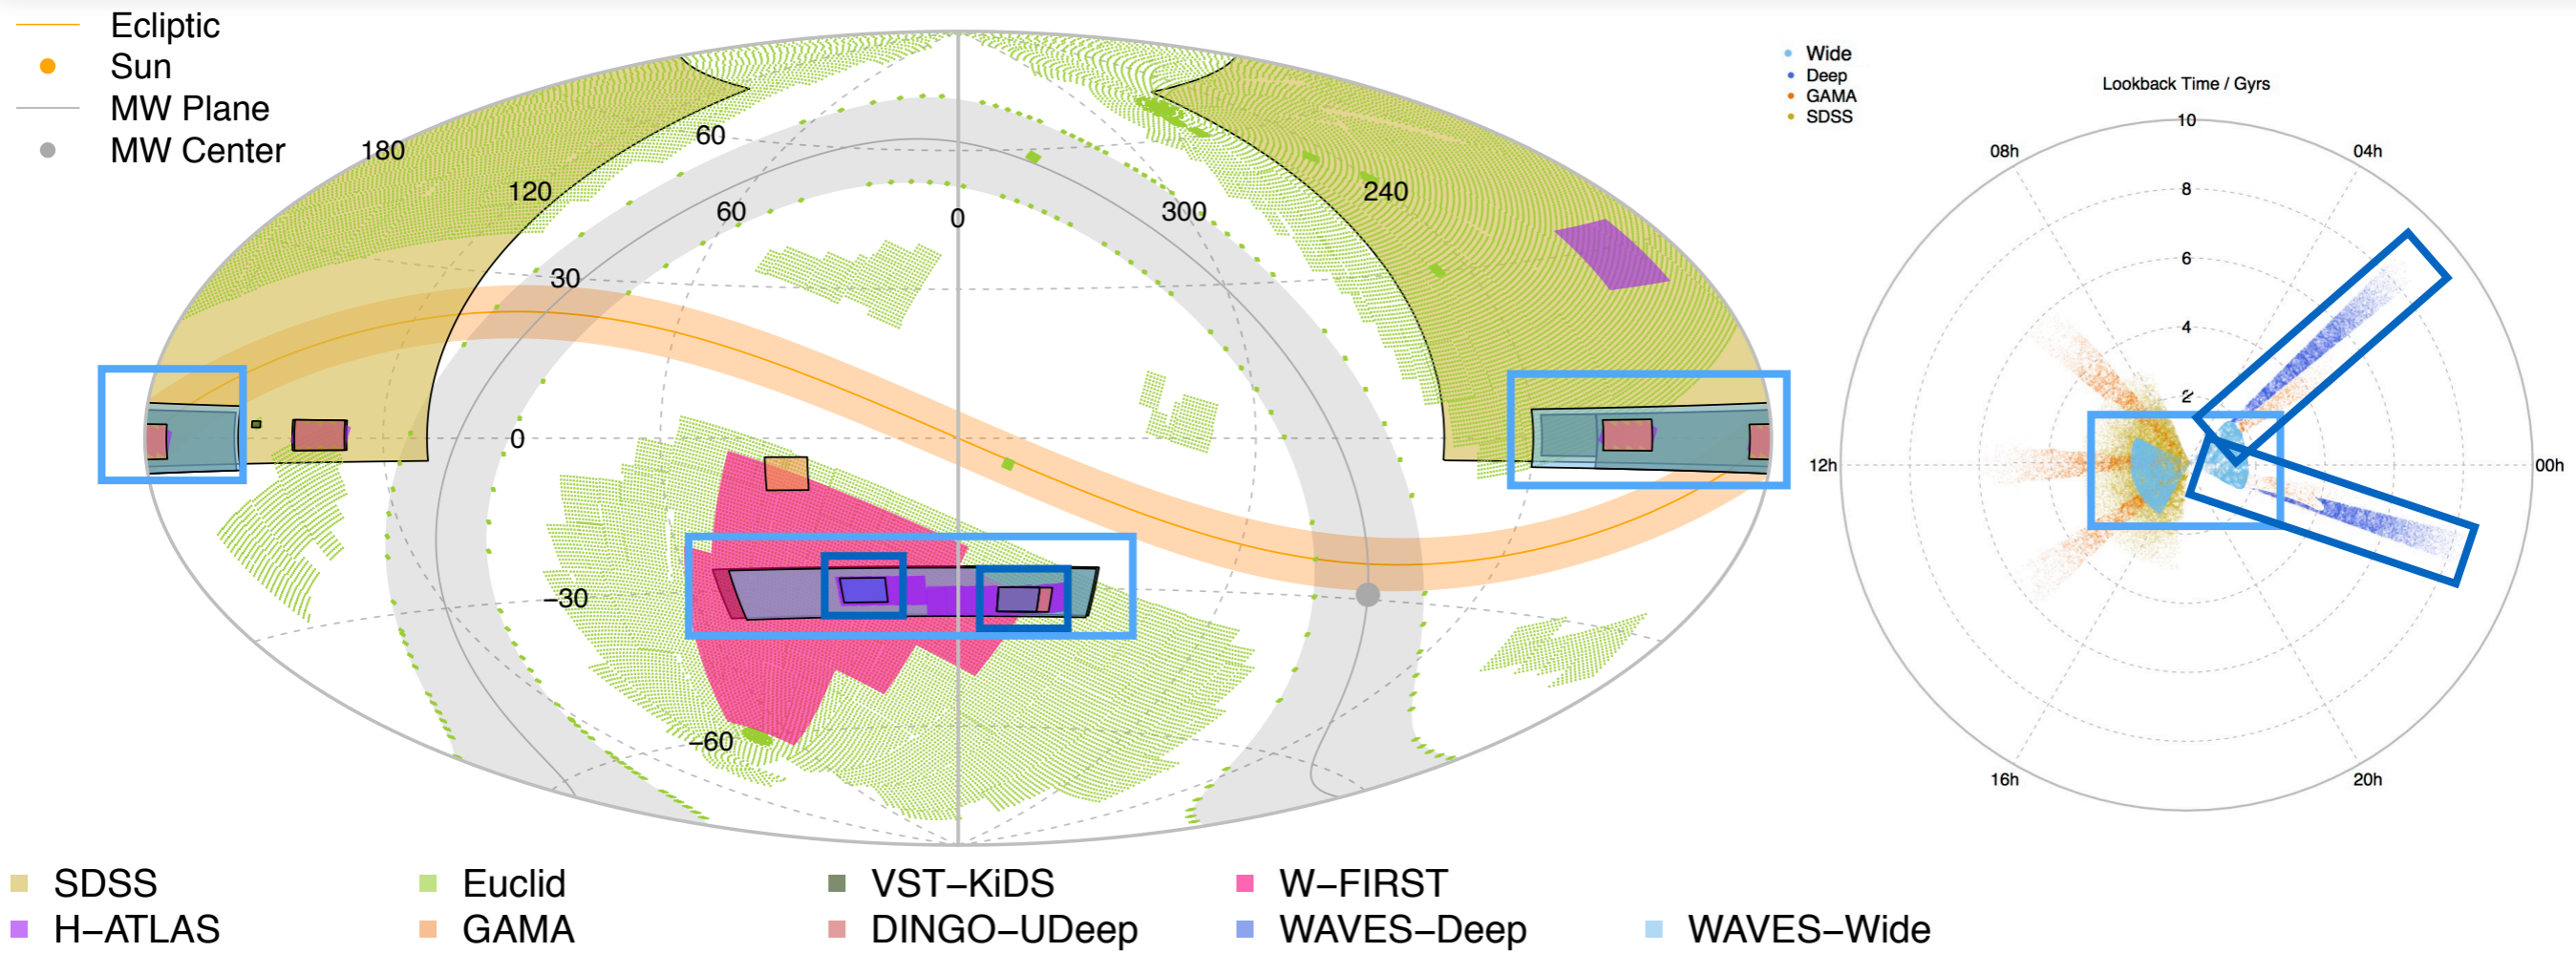

WAVES-deep - 0.5M galaxies in DINGO-UDeep/EMU-early science/  
GLASS region, 0.5M galaxies in DINGO-Deep

- Pair/Group/Filament/Voids - HI/ Environment Science
- Redshifts with >95% completeness - Stellar mass-selected HI stacking
- Multi-wavelength photometry - Stellar masses, gas fractions, baryonic mass function, HI density, AGN classification....
- Multiple SFR diagnostics - Radio continuum SFRs - See L. Davies et al 2017

# WAVES: Survey Design

[astromap.icrar.org](http://astromap.icrar.org)

## WAVES wide

- $z < 21.5$  & photo- $z < 0.2$
- 1350deg<sup>2</sup> KiDS
- ~1M targets, > 95% complete
- Stellar mass to  $\sim 10^6 M_{\odot}$
- Groups to  $10^{10} M_{\odot}$

## WAVES deep

- $z < 21.5$
- 2x50deg<sup>2</sup> regions
- ~1M targets, > 95%
- GALEX, H-ATLAS, Euclid, DINGO
- Evolution to  $z \sim 0.8$

# Putting It All Together

# Synthetic Universe For Surveys (SURFS)

- ~300Mpc box, tiered mass resolution of 130M to ~65Billion particles
- Highest resolution will resolve hosts of stellar mass  $\sim 10^8 M_{\odot}/h$  galaxies

- Orthogonal runs with fixed resolution but ~300Mpc - 2.3Gpc box
- Subset run with hydro and semi-analytics
- Will include x-rays & radio emission from shocks, AGN, SF & x-ray binaries
  - Simulations group led by Chris Power, with: Aaron Robotham, Claudia Lagos, Danail Obreschkow, Pascal Elahi, Charlotte Welker, Guido Munoz-Granda and Rhys Poulton

EMU, Wallaby, DINGO, GLASS,  
MIGHTEE, LADUMA, CHILES....

GAMA: FINAL DATA RELEASE, LEGACY, AND  
FUTURE GALAXY EVOLUTION SURVEYS

ICRAR-UWA, 6-11th November

<https://www.icrar.org/conferences/gamaworkshop/>

# Summary

Now!

Galaxies: ~300k  
Depth:  $r < 19.8$   
Completeness: 98%  
Area: 286deg<sup>2</sup>  
Redshift:  $z < 0.4$   
Radio Cont Overlap:  
**G23:** EMU-ES/GLASS  
**All:** EMU/GLEAM

Now!

Galaxies: ~16k  
Depth:  $i < 22$   
Completeness: 50%  
Area: 2deg<sup>2</sup>  
Redshift:  $z < 1.5$   
Radio Cont Overlap:  
CHILES CON-POL  
VLA COSMOS

2017-2020

Galaxies: ~60k  
Depth:  $Y < 21.1$   
Completeness: 95%  
Area: 6deg<sup>2</sup>  
Redshift:  $z < 1.0$   
Radio Cont Overlap:  
MIGHTEE  
CHILES CON-POL  
VLA COSMOS

2021-2026

Galaxies: ~2M  
Depth:  $z < 21.5$   
Completeness: 95%  
Area: wide: 1350deg<sup>2</sup>  
deep: 100deg<sup>2</sup>  
Redshift: wide:  $z < 0.2$   
deep:  $z < 1.2$   
Radio Cont Overlap:  
**All:** EMU/GLEAM  
**Deep:** GLASS

If you would like to get involved with any of these surveys come and talk to me! OR [luke.j.davies@uwa.edu.au](mailto:luke.j.davies@uwa.edu.au) / [@astrowelshluke](https://twitter.com/astrowelshluke)
